Data structures

For week 4 I created a binary search function following the pseudo code and instructions Jo gave me both in person and via the presentation slides. However, as the slides and pseudo code obviously did not contain the whole functional code I struggled a bit, particularly with the whole DateTime part as I didn't know that was a thing beforehand. The process for the advanced data structures, such as trees or hash maps, I decided to go with the trees. There was no reason for that other than it sounding a bit more intuitive when Jo explained it the first time. As with the binary search I simply followed the pseudo code from the presentation as well as getting help from both Jo and my classmates to solve how to do it.

I think the entire course material in and of itself has been challenging to understand because of its complexity. Particularly the sorting algorithms and how they work. To overcome the struggles, I essentially just asked a lot of questions to both Jo and my classmates regarding the various things, like what part of the code does what and why do I need to change this int into something else and what not.

Once we received pseudo code to look through, I found that it was a lot easier to follow and do a bit of work myself. It was only during the final stretch I required help from Jo. However something that I still feel confused about is a general use case for the things we've learnt and I believe that will only be solved through experience.
